Preparation of **dimethyl ether** (I) comprises vapour phase **dehydration** of **methanol** (II) over **alumina** catalyst (III) containing at least one oxide(s) of Gp. IIIA metal(s). High purity gamma-**alumina**, its **specific surface area** 100-700 sq.m/g, is used to prepare catalyst. One or more salt(s) of Gp.IIIA metal(s) is supported on **alumina** by usual manner to become content of Gp.IIIA metal oxide(s) in catalyst to 0.005-80 weight% (pref. 0.5-20 weight%), then Gp.IIIA metal salt(s)/**alumina** is roasted at 400-700 deg.C to prepare catalyst.

USE/ADVANTAGE - (I) is used as aerosol **gas** instead of freon **gas**. Some modified **alumina** catalysts are known already, but those are insufficient in terms of life-span, activity, preparation etc. This catalyst is prepared from available materials, and shows high activity for a long time. (I) is prepared in high yield quite selectively by using the catalyst.

AB This invention relates to multiphase catalysts, the preparation of the said catalysts, and catalytic processes employing such catalysts. The multiphase catalysts are comprised of a porous solid carrier upon which a liquid-phase catalyst is disposed. The liquid-phase catalyst includes liquid compounds which have catalytic activity, and also dissolved and dispersed solutes in a solvent. The multiphase catalysts are prepared by absorbing the liquid phase on the porous solid carrier, and may also have the liquid phase dissolved in a low boiling solvent which is later removed. The latter procedure provides intimate dispersion. The catalytic processes employing the multiphase catalysts include hydroformylation, isomerization, oxidation, carbonyl conversion and carbonylation reactions.
